Lexari

SOLANA MOBILE HACKATHON · CLOCK IN 2026

Your own AI agents, working onchain.

Personalized AI agents with one USD balance, funded Solana-first, that swap, bridge, trade and pay across chains. Every move waits for your tap.

INTRODUCTION

A personal agent for every Seeker owner.

Lexari gives people their own personalized AI agents that work onchain. You sign up with Google or email, name an agent, choose the model it runs on, and fund a single USD balance. From there your agent can research, swap, bridge, trade and pay on your behalf, on whichever chain the opportunity lives.

The product is built around one rule: **nothing moves without you.** Every swap and payment is presented as an in-app Confirm card that you approve before it runs. Agent permissions are scoped and revocable onchain, so help never turns into a black box holding your money.

This document is our submission companion for CLOCK IN, the Solana Mobile hackathon run with RadiantsDAO. It walks through the problem we are solving, the product as it runs today at app.lexari.ai, how Lexari uses Solana Mobile and SKR, the system architecture, the partners behind each capability, and where we are going next.

> **HOW JUDGES CAN READ THIS**
>
> Each section notes the hackathon criterion it speaks to: Stickiness and Product-Market Fit, User Experience, Innovation and X-Factor, and Presentation and Demo. A full mapping is in Appendix A.

Funding
One USD balance, Solana-first, 120+ coins accepted

Reach
Any chain through Aurora Intents

Models
Lamina, Grok, Kimi, Qwen, OpenAI, Claude via 0G

Safety
Confirm card on every swap and payment

PRESENTATION AND DEMO

1 Overview

Lexari is a consumer app for personal AI agents that act onchain. It ships as a Next.js 16 web app at app.lexari.ai and an Expo mobile app for Android and Seeker, sharing one account, one balance and the same agents.

Desktop sign-in at app.lexari.ai: Google or email, no password to remember.

Who it is for

Crypto-curious and crypto-native mobile users who want results onchain without managing a wallet per chain.

What it does

Turns plain-language goals into proposed actions: swaps, bridges, trades and payments, each confirmed by you.

STICKINESS AND PRODUCT-MARKET FIT

2 Problem

Onchain finance is powerful, but from a phone it still feels like a part-time job.

2.1

Too many surfaces

Every chain brings its own wallet, gas token, bridge and interface. Users spend their time moving balances around instead of acting on an idea.

2.2

Signal lives on desktop

Smart-money flows and disciplined exits such as take-profit and stop-loss sit in dashboards that most mobile users never open.

2.3

AI that acts feels unsafe

Assistants that hold keys or auto-sign transactions ask for blind trust. Most people, rightly, will not give it.

2.4

No daily reason to open the wallet

Seeker owners carry a secure, crypto-native phone. What is missing is an experience that earns a place in their day.

INNOVATION AND X-FACTOR

3 Solution

Personal agents you create, name and fund, that work on any chain and never sign without you.

One USD balance. Top up once, Solana-first. Agents route onto any chain through Aurora Intents (1Click Swap API).

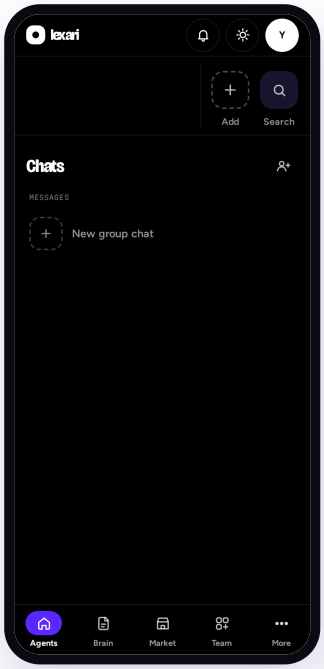

Choose the model. Lamina, Grok, Kimi, Qwen, OpenAI or Claude, all served through 0G.

Agents that act. Nansen smart-money informed trades, Hyperliquid take-profit and stop-loss, Kuru on Monad.

A memory that lasts. Each agent keeps a brain of what it has learned about you.

Never auto-signed. Every swap or payment is a Confirm card. MetaMask agent wallet permissions are revocable onchain.

Agents pay agents. Hire specialists such as ORE Miner from the marketplace.

Agent brain and memory

USER EXPERIENCE

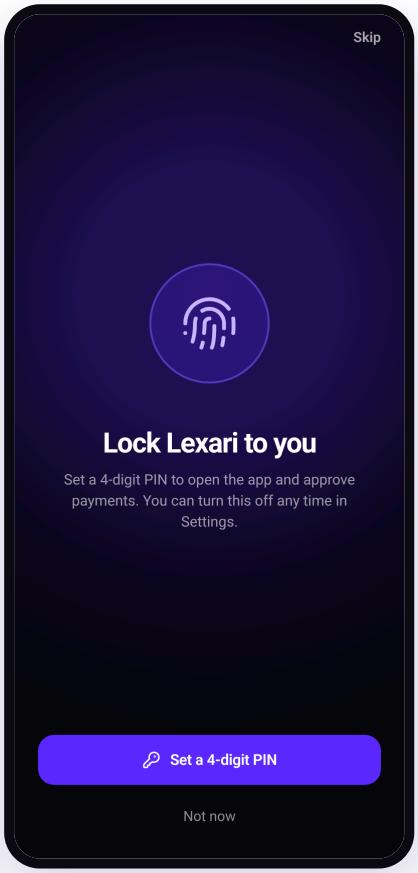

4 Product tour

4.1 Sign-up and security

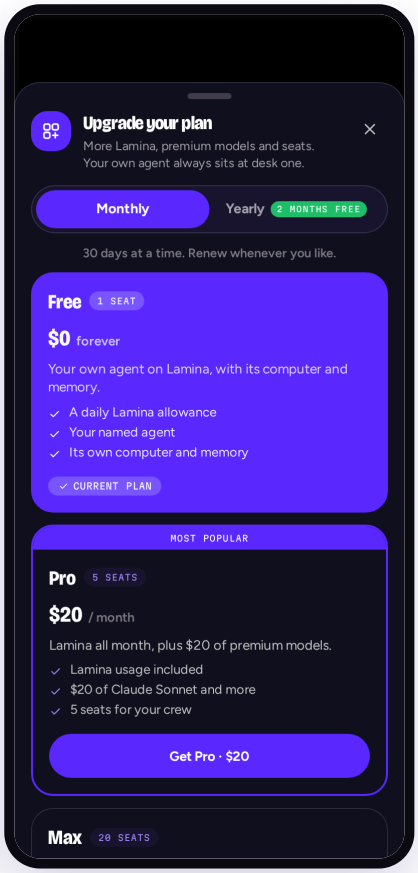

Getting in takes one tap with Google or email. Right after sign-up, users can lock the app with a PIN that also gates payment approvals, and link passkeys through Mera.

Sign in on mobile

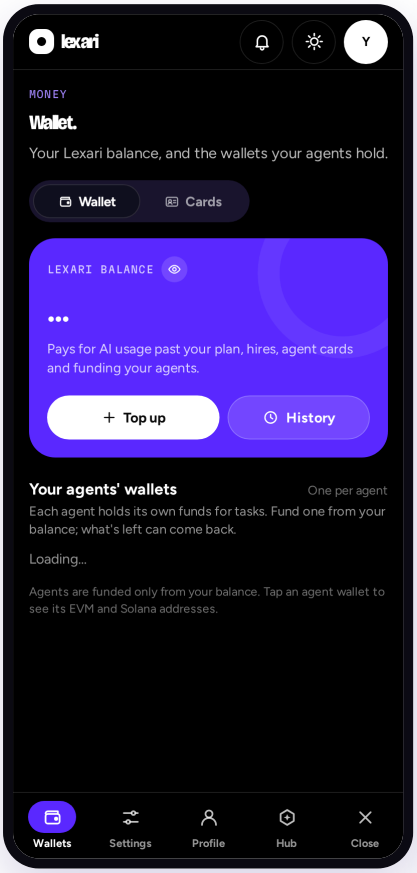

Lock Lexari with a PIN

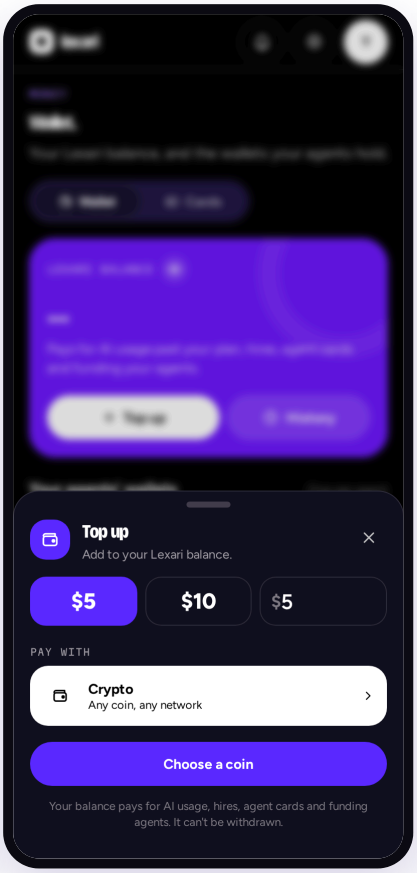

Plans and seats

4.2 Funding your balance

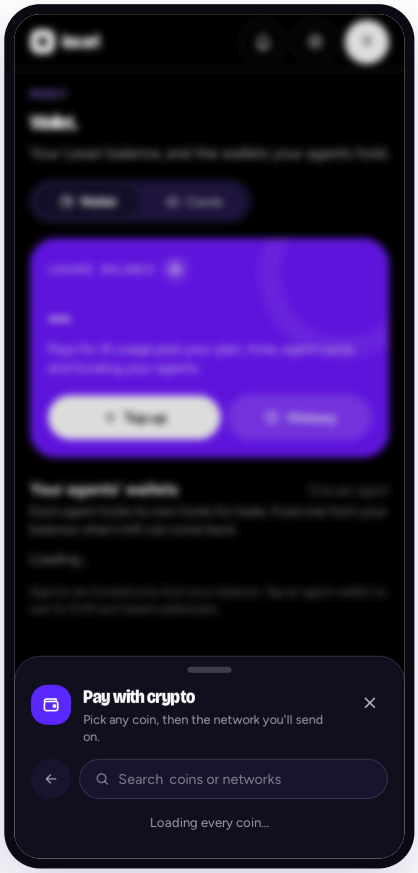

One Lexari balance pays for AI usage, hires, agent cards and funding agents. Top up $5, $10 or a custom amount with crypto from 120+ coins, including SKR with a 5% bonus credit.

Wallet and agent wallets

Top up: $5, $10 or custom

Pay with crypto, pick a coin

CONFIRM CARD

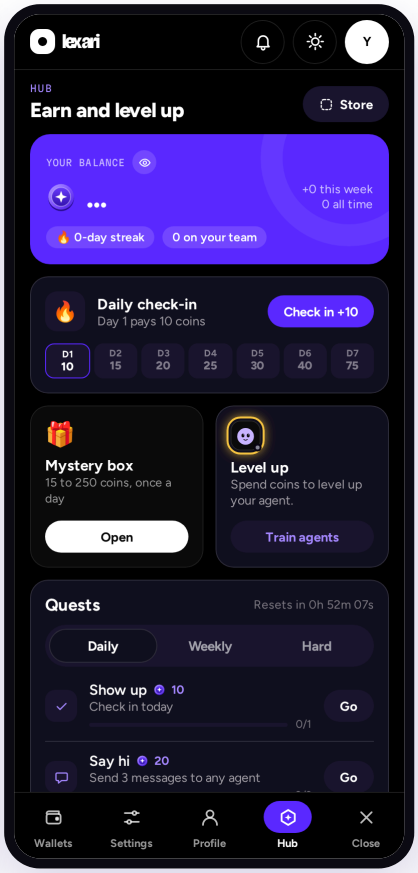

Each payment or swap the agent proposes is shown as a Confirm card with amount and route before anything is signed. Pay with SKR is offered directly on that card.

4.3 Agents, brain and marketplace

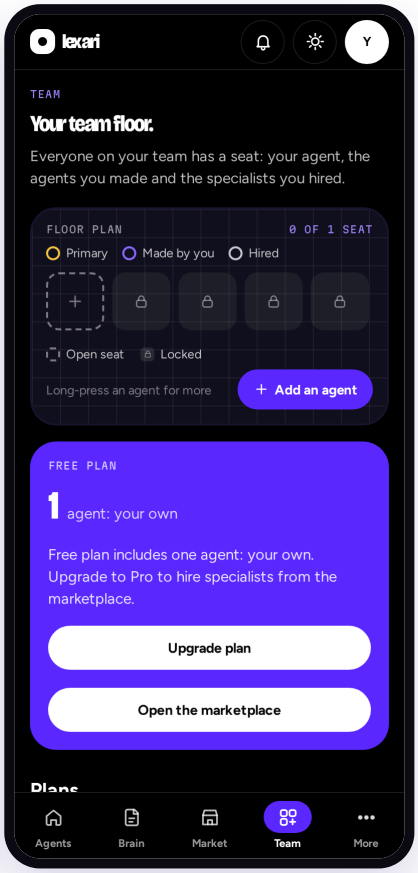

The marketplace lets you hire specialist agents, and agents can pay other agents. The Hub adds daily check-ins, streaks and quests, and the Team floor shows the agents working for you.

Marketplace: hire specialists

Hub: check-ins and quests

Team floor

STICKINESS AND PMF · SKR INTEGRATION

5 SKR and Solana Mobile

Seeker is the natural home for an agent that needs your signature.

5.1

Pay with SKR

SKR is accepted for top-ups with a 5% bonus credit, offered directly on the Confirm card. SKR becomes the most rewarding way to power your agents. This is a payment integration, not staking.

5.2

Approval on a Confirm card

Every swap or payment an agent proposes is shown as an in-app Confirm card with amount and route. Nothing runs until you approve it there.

5.3

A daily habit

Agent alerts, executed moves, take-profit hits, daily check-ins and quests give Seeker owners a reason to return every day.

5.4

Solana-first, never single-chain

Funding starts on Solana, and agents reach any chain through intents. Distribution is planned through the Solana dApp Store.

TECHNICAL DEPTH

6 Architecture

Agents think offchain. Money moves only through intents the user has confirmed.

CLIENTS

Expo Android app for Seeker
Next.js 16 web app
Google or email auth, Mera passkeys
In-app Confirm card approvals

→

AGENT CORE

Model router via 0G
Planner: chat to action proposal
Agent memory (brain)
Confirm card gate

→

EXECUTION

Aurora Intents swaps and bridges
Hyperliquid TP and SL
Kuru on Monad
MetaMask agent wallet

Money and data rails One USD balance (Agora AUSD) · Solana-first top-ups in 120+ coins incl. SKR · Nansen smart-money signal · Alchemy chain data · Tempo card for paid user-created agents

Request lifecycle

1. User asks an agent in plain language.
2. The selected model plans using memory and market signal.
3. The plan becomes a Confirm card with amount, route and risk settings.
4. The user approves the in-app Confirm card. Nothing is auto-signed.
5. The intent executes and results flow back to the agent feed.

WHAT EACH ONE DOES

7 Partners

Best-in-class rails behind one simple app.

PARTNER	ROLE IN LEXARI
Solana Mobile	Seeker device, SKR payments, dApp Store distribution
Aurora Intents	1Click Swap API for swaps and bridges onto any chain
0G	Serves every model an agent can run on
Nansen	Smart-money signal behind agent trade ideas
Hyperliquid	Take-profit and stop-loss execution
Kuru	Onchain trading on Monad
MetaMask	Agent wallet with revocable onchain permissions
Mera	Passkeys linked after sign-up
Agora	AUSD stablecoin behind the USD balance
Alchemy	Chain data and node infrastructure
Tempo	Card for paid, user-created agents
ORE Miner	Marketplace agent that other agents can pay

VISION

8 Roadmap

Now

Personal agents with model choice, one USD balance, crypto top-ups including Pay with SKR, Confirm cards, marketplace, Hub check-ins and quests.

Next

Android release for Seeker and listing on the Solana dApp Store. More marketplace specialists and agent-to-agent payments.

Later

Deeper SKR utility across the app and more execution venues reached through intents.
