Lexari

COLOSSEUM · CRYPTO WORLD'S FAIR 2026 · SOLANA TRACK

Your own AI agents, working onchain.

Personalized AI agents with one USD balance, funded Solana-first, that swap, bridge, trade and pay across chains. Confirm cards keep you in control of what moves.

INTRODUCTION

A personal onchain agent for everyone.

Lexari gives people their own personalized AI agents that work onchain. You sign up with Google or email, name an agent, choose the model it runs on, and fund a single USD balance. From there your agent can research, swap, bridge, trade and pay on your behalf, on whichever chain the opportunity lives.

Solana is the base layer: funding is Solana-first, agents and their memory are registered by the Lexari Anchor program on devnet, agents hire and pay each other over x402 on Solana devnet, and Android users sign with their own wallet over Solana Mobile Wallet Adapter. Swaps and payments are presented as in-app Confirm cards. Section 7 explains exactly who holds which funds, including one known gap we are closing.

This document accompanies our submission to Colosseum's Crypto World's Fair hackathon in the Solana track. It covers the problem, the product as it runs today at app.lexari.ai, why Lexari is Solana-native, the architecture, funds and safety, an honest status for every feature, onchain proof, and the business we are building.

HOW JUDGES CAN READ THIS

Sections are tagged with the Colosseum criteria they answer: Functionality, Potential Impact, Novelty, UX, Open-source and Business Plan. Status labels mean: `LIVE` runs on the production path, `PARTIAL` real code not yet exercised or configured in production, `TESTNET` runs on devnet or a testnet, `PLANNED` not built yet. A full criteria mapping is in Appendix A.

Funding
One USD balance, Solana-first, 120+ coins listed

Onchain
Lexari Anchor program and x402 agent payments on Solana devnet

Models
Lamina, plus Kimi and Qwen via 0G; Claude and OpenAI with your own key

Safety
Confirm cards; your wallet stays self-custodied

FUNCTIONALITY

1 Overview

Lexari is a consumer app for personal AI agents that act onchain. It ships as a Next.js 16 web app at app.lexari.ai and an Expo mobile app for Android and Seeker, sharing one account, one balance and the same agents.

Desktop sign-in at app.lexari.ai: Google or email, no password to remember.

Who it is for

Crypto-curious and crypto-native mobile users who want results onchain without managing a wallet per chain.

What it does

Turns plain-language goals into proposed actions: swaps, bridges, trades and payments, each shown to you as a Confirm card.

POTENTIAL IMPACT

2 Problem

Onchain finance is powerful, but from a phone it still feels like a part-time job.

2.1 Too many surfaces

Every chain brings its own wallet, gas token, bridge and interface. Users spend their time moving balances around instead of acting on an idea.

2.2 Signal lives on desktop

Smart-money flows and disciplined exits such as take-profit and stop-loss sit in dashboards that most mobile users never open.

2.3 AI that acts feels unsafe

Assistants that hold keys or auto-sign transactions ask for blind trust. Most people, rightly, will not give it.

2.4 No daily reason to come back

Wallets are built for holding and sending. What is missing is an assistant that earns a place in people's day and acts on their behalf.

NOVELTY

3 Solution

Personal agents you create, name and fund, that work across chains while you approve what moves.

One USD balance. LIVE Top up once, Solana-first. Cross-chain routes through Aurora Intents (1Click Swap API) PARTIAL.

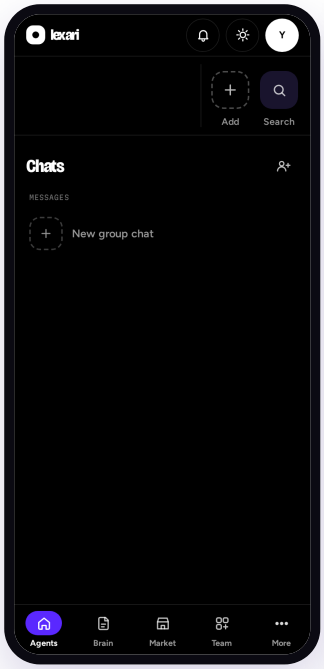

Choose the model. PARTIAL Lamina by default, Kimi and Qwen via 0G, Claude and OpenAI with your own key.

Agents that act. Nansen smart-money signal LIVE, Hyperliquid trading TESTNET, Kuru on Monad PARTIAL.

A memory that lasts. Each agent keeps a brain of what it has learned about you.

Confirm cards. LIVE Swaps and new payees always need your approval; within-budget agent payments are moving behind Confirm too (section 7).

Agents pay agents. LIVE (DEVNET) Hire specialists from the marketplace and pay them over x402.

Agents and chats

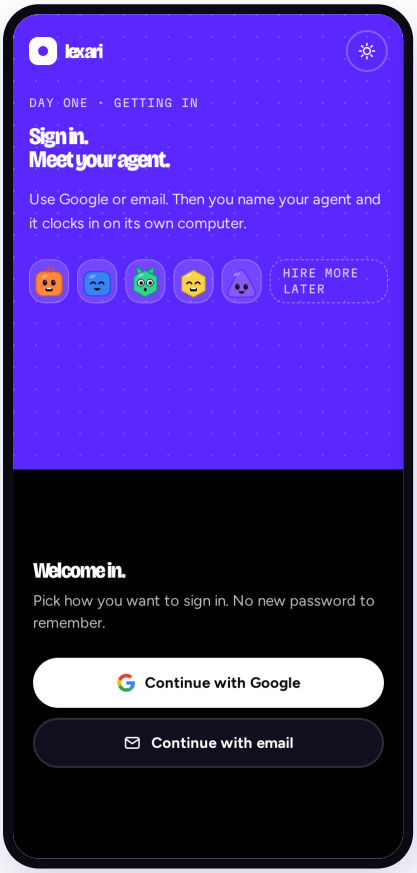

Agent brain and memory

UX

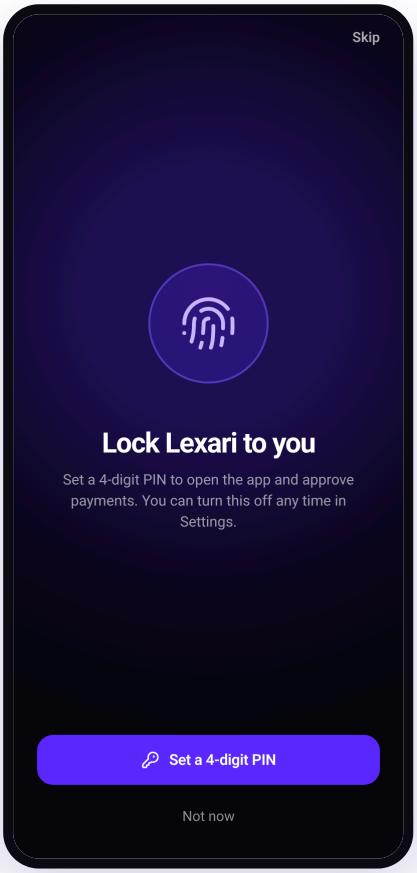

4 Product tour

4.1 Sign-up and security

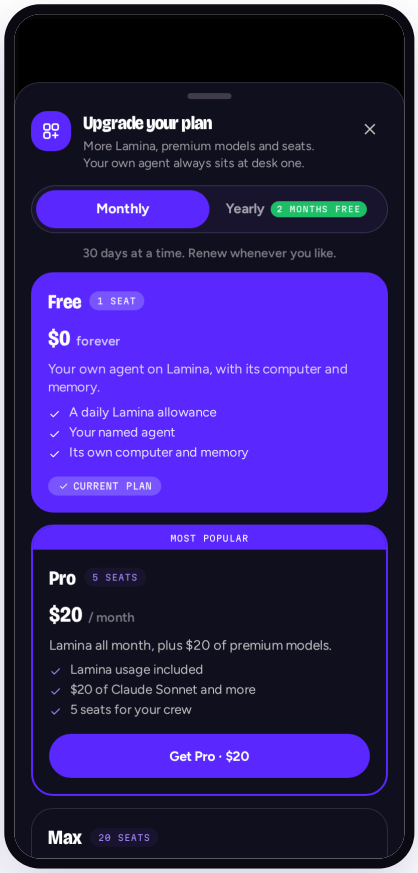

Getting in takes one tap with Google or email. Right after sign-up, users can lock the app with a PIN that also gates payment approvals. On the web, passkeys can be linked through Mera PARTIAL. On Android, users can sign in with their own Solana wallet over Mobile Wallet Adapter LIVE (CODE).

Sign in on mobile

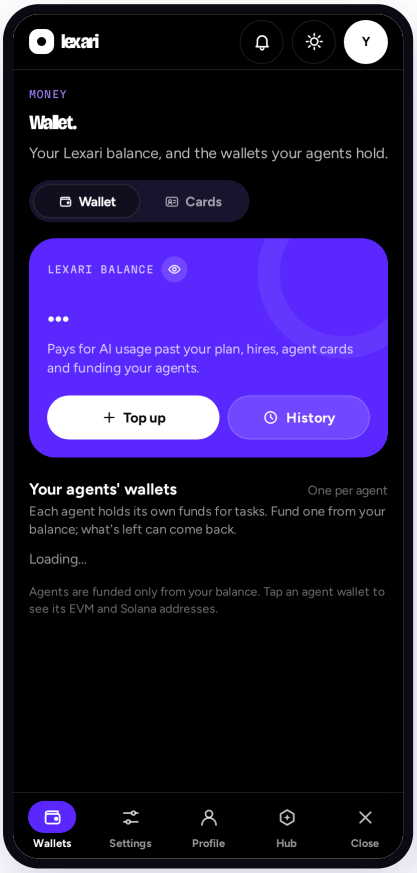

Lock Lexari with a PIN

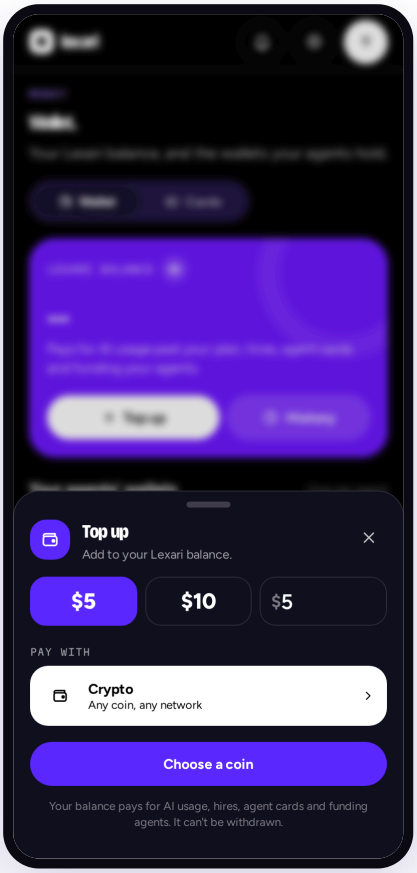

Plans and seats

4.2 Funding your balance

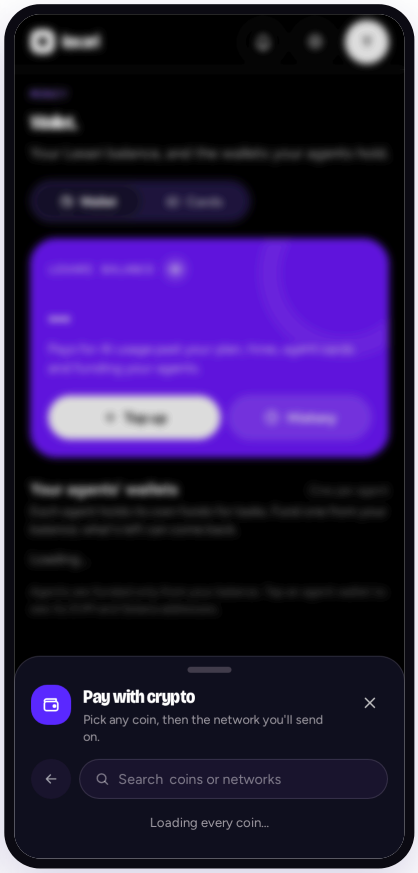

One Lexari balance pays for AI usage, hires, agent cards and funding agents. Top up $5, $10 or a custom amount: deposit crypto from 120+ listed coins PARTIAL, or pay from your connected wallet over MWA LIVE (CODE). Depositing SKR earns a 5% bonus credit PARTIAL.

Wallet and agent wallets

Top up: $5, $10 or custom

Pay with crypto, pick a coin

CONFIRM CARD

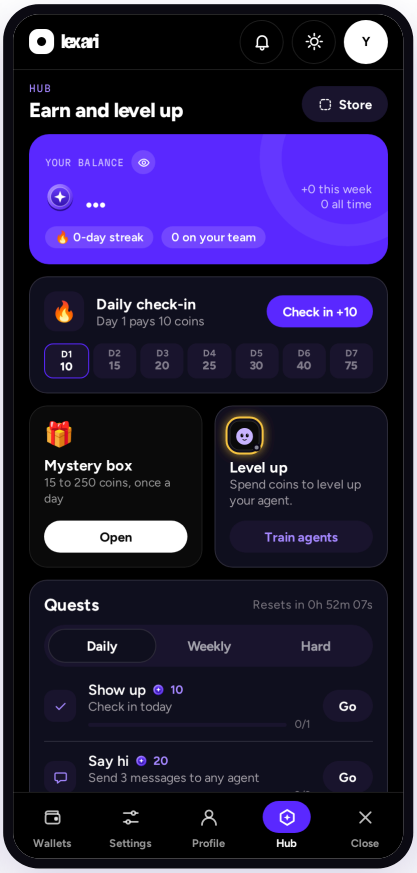

Each swap or payment the agent proposes is shown as a Confirm card with amount and route before anything is signed. Payments from your own wallet are then signed in your wallet app.

4.3 Agents, brain and marketplace

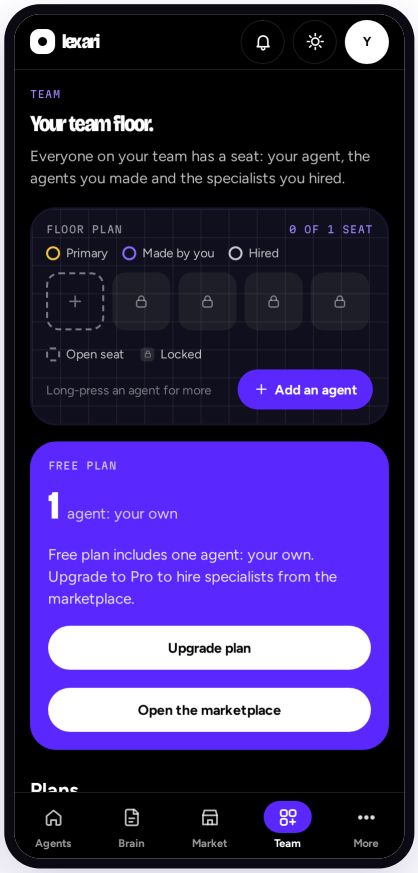

The marketplace lets you hire specialist agents, and agents can pay other agents LIVE (DEVNET). The Hub adds daily check-ins, streaks and quests LIVE (DEVNET), and the Team floor shows the agents working for you.

Marketplace: hire specialists

Hub: check-ins and quests

Team floor

SOLANA-NATIVE · OPEN-SOURCE AND COMPOSABILITY

5 Why Solana

Solana is where Lexari's identity, agents, payments and funding live. Other chains are reached through intents, not by leaving Solana.

5.1 Lexari Anchor program TESTNET

`contracts/solana/programs/lexari` registers agents and their memory and runs Hub game logic: `register_agent`, `update_agent`, `write_memory`, `revoke_memory`, `check_in`, `claim_quest`, `open_box`. Deployed on devnet; 86 onchain signatures in the production chain ledger.

5.2 Agents pay agents over x402 LIVE (DEVNET)

`server/agentpay/x402.ts` implements x402 seller and buyer flows, and `server/hires.ts` handles marketplace hires: 15 hires and 13 payments, with real devnet signatures in section 10.

5.3 Mobile Wallet Adapter LIVE (CODE)

The Expo Android app uses `@solana-mobile/mobile-wallet-adapter-protocol-web3js` in `mobileapp/src/lib/mwa.ts`: `signMessages` for Sign In With Solana and step-up checks, and `signAndSendTransactions` from the user's own wallet for the chat Send SOL card (`src/web/chat/cards.tsx`) and Pay from connected wallet top-ups (`src/components/TopUpFlow.tsx`). On Seeker and Saga, `src/lib/device.ts` surfaces Seed Vault first PARTIAL.

5.4 Solana-first funding PARTIAL

Top-ups credit one USD balance. The coin list comes live from Aurora Intents, and SKR deposits earn a 5% bonus (`content/topup.ts`, `server/topup/deposits.ts`). No SKR or Aurora deposit has been credited in production yet.

5.5 Open source and composable

Source repository at `github.com/xElvolution/lexari`, 339 commits since Sep 27, 2026. Lexari composes existing primitives (x402, Aurora Intents, Hyperliquid, MetaMask delegation, 0G) instead of rebuilding them.

TECHNICAL DEPTH

6 Architecture

Agents think offchain. Money moves only after a Confirm card, signed either by your own wallet or by your agent's wallet.

CLIENTS

Expo Android app for Seeker
Mobile Wallet Adapter: SIWS, signMessages, signAndSendTransactions
Next.js 16 web app
Google or email auth, Mera passkeys (web)

→

AGENT CORE

Model router: Lamina, Kimi and Qwen via 0G, own-key Claude and OpenAI
Planner: chat to action proposal
Agent memory (brain)
Confirm card gate and spend policy

→

EXECUTION

Lexari Anchor program (devnet)
x402 agent payments (devnet)
Aurora Intents swaps and bridges
Hyperliquid, Kuru, MetaMask delegation

Money and data rails USD balance as an off-chain ledger held by Lexari · deposits to per-user addresses, 120+ coins listed via Aurora Intents, SKR with 5% bonus · Nansen smart-money signal · Tempo card and Agora AUSD on testnets

Request lifecycle

1. User asks an agent in plain language.
2. The selected model plans using memory and market signal.
3. The plan becomes a Confirm card with amount, route and risk settings.
4. The user approves the Confirm card. Sends from the user's own wallet are signed in the wallet app over MWA; agent-wallet actions are signed by the server with the agent key.
5. The transaction executes and results flow back to the agent feed.

WHO HOLDS WHAT, AND WHO SIGNS

7 Funds and safety architecture

FUNDS	CUSTODY	WHO SIGNS	CONTROLS	STATUS
Your own wallet	Non-custodial. You hold the key in Phantom, Solflare or Seed Vault.	You, in your wallet app over MWA	Confirm card plus biometric gate; MWA calls are never made without a Confirm card (mwa.ts)	LIVE (CODE)
Lexari USD balance	Custodial, off-chain ledger held by Lexari (Postgres billing settings and credit ledger), credited in micro-USD	Lexari server	Deposits land on per-user addresses derived on the server; SKR deposits add 5%	LIVE
Agent wallets	Custodial. Keys are derived on the server per person, agent and chain; none are stored. Solana agent wallets run on devnet only.	Lexari server, after you tap Confirm	Confirm cards, per-transaction and daily limits, step-up checks, first-payee warnings, untrusted-content gating; test USDC funding capped at $25	TESTNET
MetaMask delegation	Non-custodial. Your smart account delegates a capped, expiring allowance (ERC-7710).	Your smart account	Revocable at any time	TESTNET

EVERY AGENT PAYMENT NEEDS YOUR CONFIRM

As of commit `1b47055`, agent payments to services and other agents (`pay.service`, `pay.agent`) always require a Confirm card, even within the agent's budget. A payment over the budget, to a new payee, or after untrusted content says why on the card.

BEFORE MAINNET FUNDS

Agent and deposit keys are derived from a single server secret. That is acceptable on devnet, and it will be replaced before any mainnet funds with KMS or HSM custody, MPC, or delegation where you keep custody.

HONEST, FROM OUR CODE AND PRODUCTION AUDIT

Feature status

FEATURE	STATUS	EVIDENCE
Next.js web app (app.lexari.ai)	LIVE	Production deployment
Expo Android app	LIVE (CODE)	Expo and expo-router app in mobileapp/; APK artifact not verified in the audit
Mobile Wallet Adapter signing	LIVE (CODE)	mobileapp/src/lib/mwa.ts
Seeker detection, Seed Vault first	PARTIAL	src/lib/device.ts; Seed Vault via MWA only
USD balance ledger	LIVE	Custodial off-chain ledger; 15 production ledger rows
Crypto deposits, 120+ coins	PARTIAL	Coin list live from Aurora Intents; no Aurora-credited deposit yet
SKR top-up, 5% bonus	PARTIAL	Bonus logic in place; no SKR deposit credited yet
Agent swaps and bridges	PARTIAL	Aurora Intents quote, route and status; 0 production executions
Model routing	PARTIAL	0G for Kimi and Qwen; Lamina default; Claude and OpenAI own key
Confirm cards	LIVE	pay.service and pay.agent always require a Confirm card (commit 1b47055)
Marketplace hires, agent payments	LIVE (DEVNET)	x402 seller and buyer; 15 hires, 13 payments
Agent wallets	TESTNET	Server-derived keys, Solana devnet
Lexari Anchor program	TESTNET	Deployed on devnet, not on mainnet
Quests and daily check-ins	LIVE (DEVNET)	300 quest events, 59 claims
Mobile push alerts	PARTIAL	Coded; no Expo tokens in production
Solana dApp Store listing	PLANNED	Android distribution

WHAT EACH ONE DOES

9 Partners

Best-in-class rails behind one simple app.

PARTNER	ROLE IN LEXARI	STATUS
Solana Mobile	Mobile Wallet Adapter signing, Seeker detection, SKR rail, dApp Store distribution	LIVE (CODE)
Aurora Intents	1Click Swap API: coin list, quotes, routes for swaps and bridges	PARTIAL
0G	Serves Kimi and Qwen through the 0G router	PARTIAL
Nansen	Smart-money wallet signal, read-only	LIVE
Hyperliquid	API-wallet trading; mainnet refused for now	TESTNET
Kuru	Swaps on Monad via the Kuru SDK; not configured in production	PARTIAL
MetaMask	ERC-7710 delegation with revocation, on Monad testnet	TESTNET
Mera	Passkey-derived keys on the web	PARTIAL
Agora	AUSD balance, faucet, pay and send on Monad testnet	TESTNET
Alchemy	Chain data client; not configured in production	PARTIAL
Tempo	Card and pathUSD top-ups on Moderato testnet	TESTNET
ORE Miner	Marketplace miner agent, devnet practice mode	PARTIAL

BUSINESS PLAN · POTENTIAL IMPACT

11 Business model and roadmap

11.1 How Lexari makes money

Plans are already priced in the app (Settings, Billing). Everything else is paid from the same USD balance.

PLAN	WHAT IT INCLUDES	PRICE
Free	Your own agent on Lamina with its computer and memory, a daily Lamina allowance, 1 seat	$0
Pro	Lamina all month plus $20 of premium models, 5 seats	$20 / month
Max	3x the Lamina usage of Pro, $60 of premium models, 20 seats and team chats	$60 / month
Ultra	10x Pro usage, $200 of premium models, 100 seats PLANNED	$200 / month

Further revenue lines in the product: premium-model usage billed from the balance, marketplace hires between agents LIVE (DEVNET), and the Tempo card for paid, user-created agents TESTNET. We have no paying-customer revenue to report yet.

11.2 Roadmap

Now

Web app, MWA wallet signing in the Android app, USD balance, Confirm cards, marketplace hires and agent payments on devnet, Hub quests on the Lexari devnet program, Nansen signal.

Next

Confirm cards on every agent payment. Lexari program on mainnet. First credited SKR and Aurora deposits. Kuru and Alchemy configured. Expo push alerts.

Later

Mainnet agent custody through KMS or HSM, MPC, or user-held delegation. Testnet integrations moved to mainnet. Ultra plan.
